Structure of brake system and parts

Raw material and application

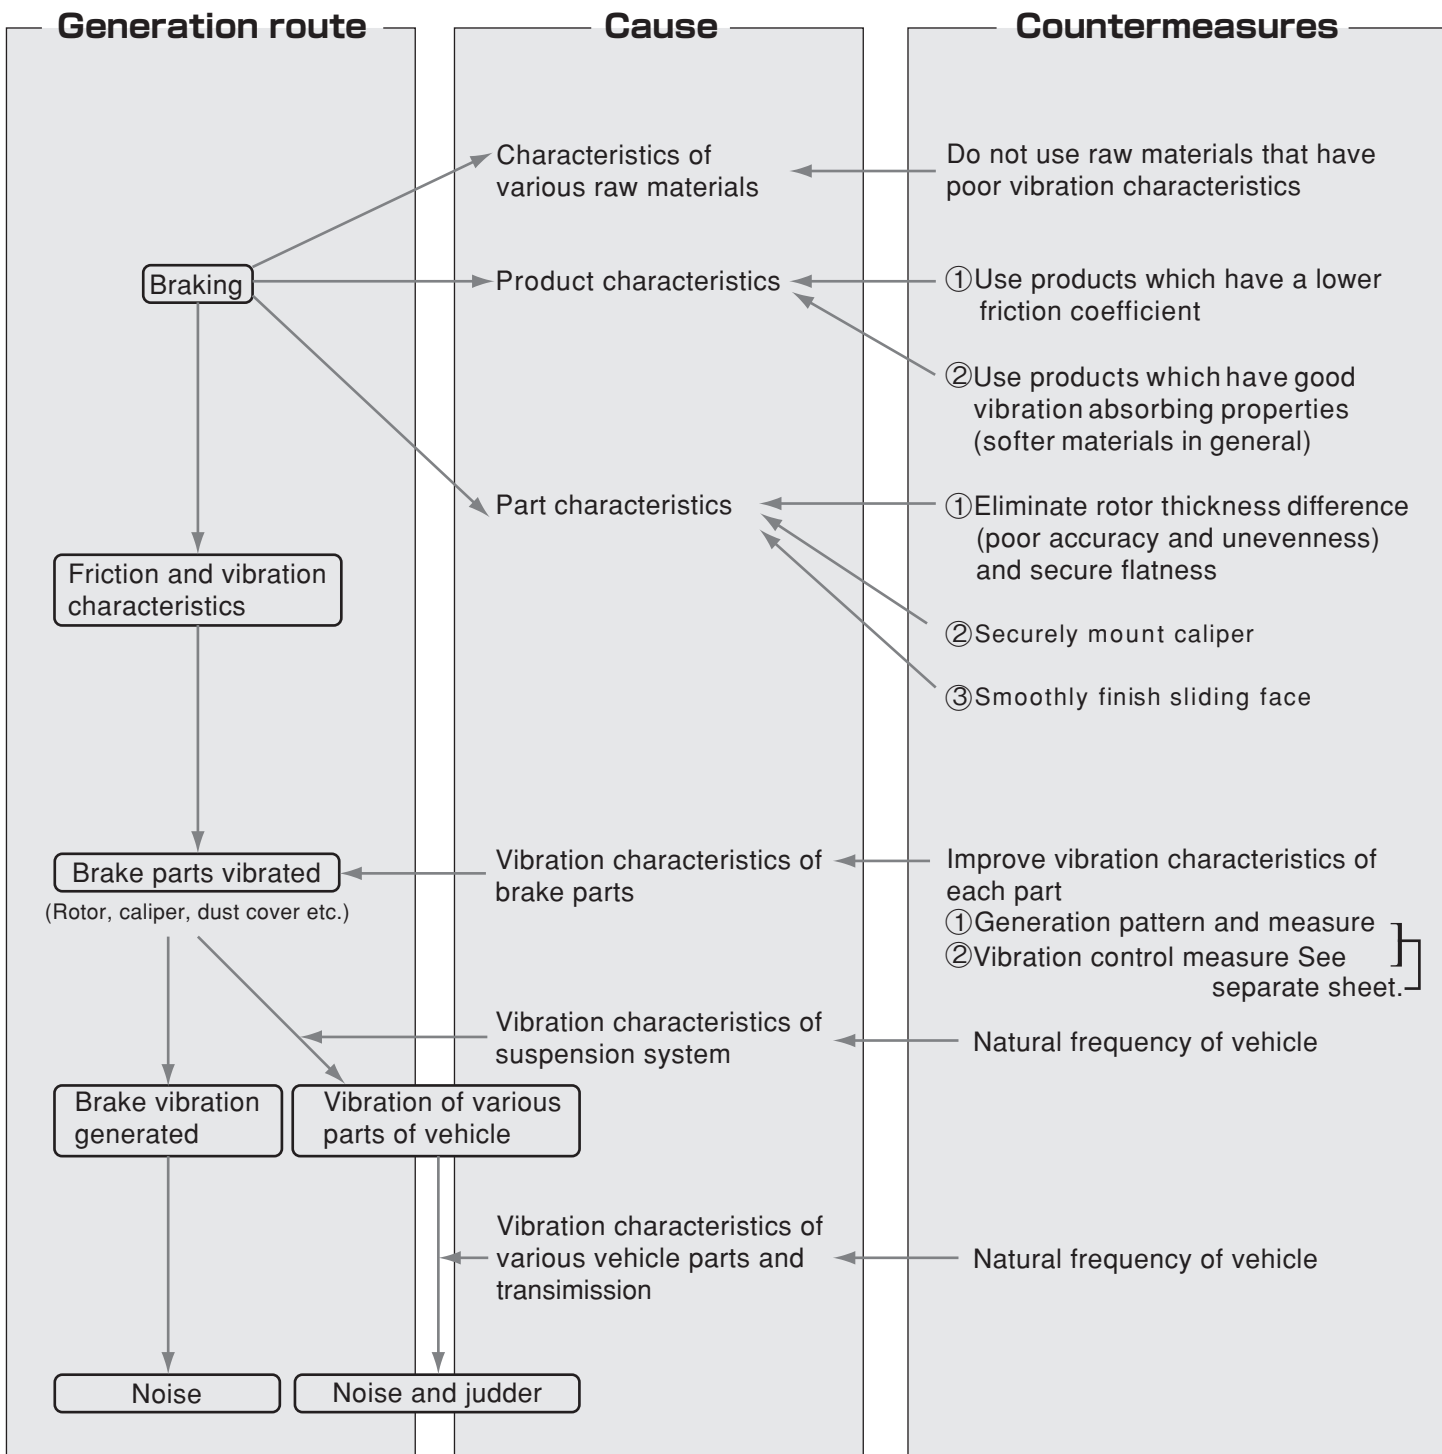

(Structure of pad is similar to reinforced concrete)

Concrete	Raw material for pad	Application
Reinforcing bar	Aramid fiber (Chemical fiber) Steel and non-ferrous metal fiber Asbestos	Used for base material Absorbing vibrations, and providing high strength and high friction
Cement	Resin (Thermoset resin)	Used for binder
Small stones	Brass powder, copper powder, etc.,	Local heating prevented by thermal conductive property
Gravel	Graphite, cashew dust, etc.,	Stability of wear-resistant performance and friction coefficient improved

Required performance of disc pad

No	Item	Performance	Description
1	Stability	•Braking level	Friction coefficient (μ) should be appropriate and stable. $\mu = \text{Braking force} / \text{Pressing force}$
		•Braking effect	○Speed spread ⇒The smaller the variation of friction coefficient (μ) due to velocity, the better. ○Water recovery ⇒Friction coefficient (μ) loss due to water leakage should be recovered as the number of brakings increases. JASO requires 15 brakings for full recovery ○Morning sickness (Morning effect) ⇒A phenomenon where the friction coefficient (μ) increases as affected by moisture. The smaller the number generated the better. It should be recovered soon even if the phenomenon is generated.
		•Fading and recovery	○Fading ⇒Temperature rises due to friction heat to lower friction coefficient (μ). This phenomenon is called fading phenomenon. The smaller the loss of braking force, the better. ○Recovery ⇒To be rapidly recovered to the original friction coefficient (μ) level
		•Strength	No crack generation during application is allowable
2	Durability	•Wear	Wear should be stable and an amount of wear should be small.
		•Face attack	The following phenomena should be rarely generated: ☆Scoring = Generation of scratches on friction surface ☆Heat crack = Cracks in friction surface ☆Heat spot = Local color change and spots on friction surface
3	Discomfort	•Squeak	Has no relation to performance, but undesirable feeling may be generated ☆Frequently generated in the midst of braking ☆Easily generated after excessive repetition of braking (thermal hysteresis) ☆Easily generated due to atmospheric temperature ☆More easily generated after long use rather than just after starting new one
		•Judder	Means vibration. No chattering allowable.
		•Feeling	Braking should be performed smoothly.

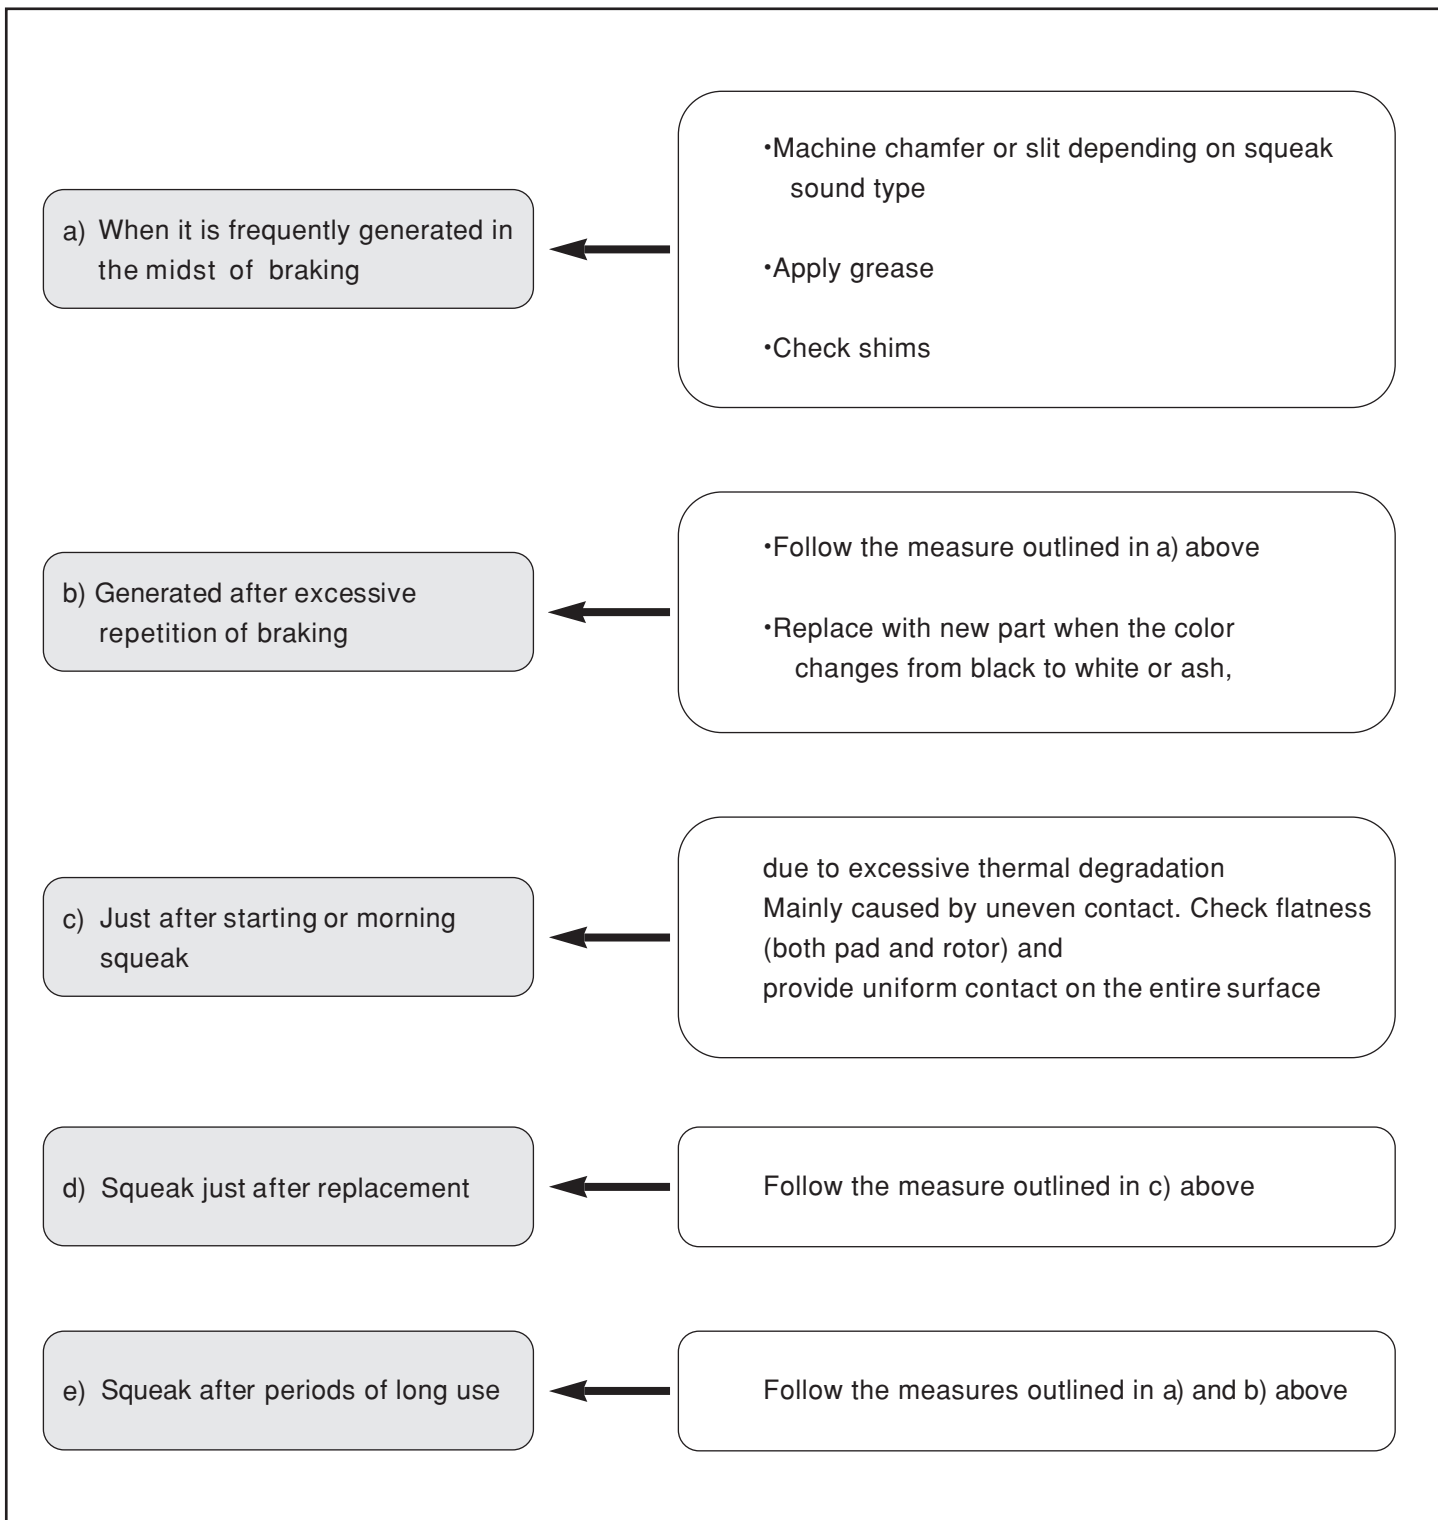

Mechanism of squeak generation and countermeasures

General classification of brake squeak

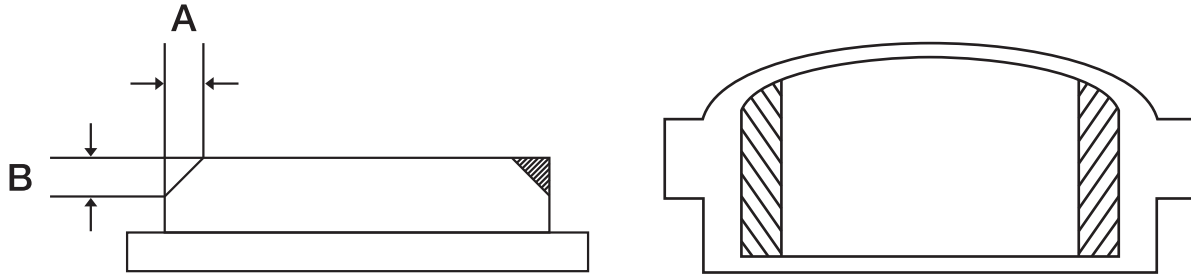

Item \ Frequency	400 - 700Hz	1 - 6kHz	7 - 11kHz
Name of squeak	Groan	Squeal	Squeak
Tone	Goo	Quee	Chee
Main vibration source	Resonance of drum and/or caliper	Resonance of shoe and/or disc	Elastic vibration of lining and/or pad

① Squeak generation pattern and countermeasures

② Vibration control measure

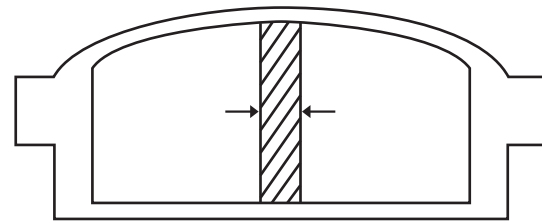

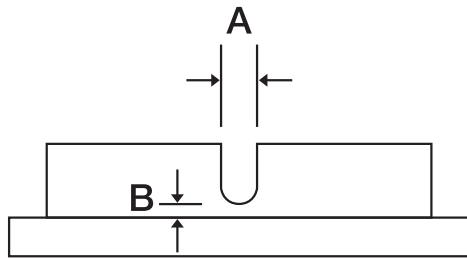

1. Partial machining

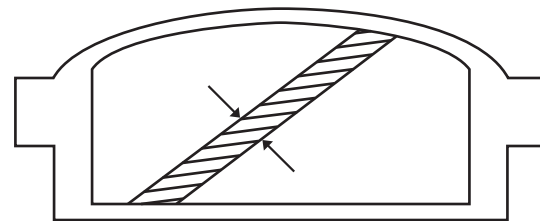

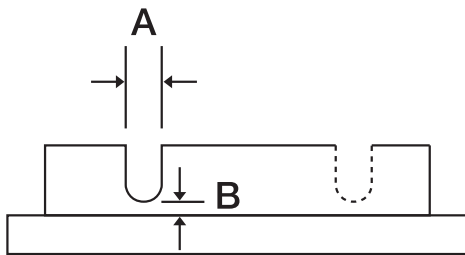

1) Chamfer cut for edge: Significant effect on "quee" and "chee" sound.

- Allowable machining dimension
- ① Maximum allowable area to be removed should be no more than 20% of friction surface.
 - ② Maximum value of dimension A should be 15 mm.
 - ③ Maximum value of dimension B should be 8mm.

2) Slit machining (one or two slits may be machined)

Machine slit at a right angle in a longitudinal direction
→ Significant effect on "quee" and "goo" sound.

Machine slit diagonally in a longitudinal direction.
→ Significant effect on "goo" sound.

- Allowable machining dimension
- ① Machining width A should be 2.5 ± 0.5 mm
 - ② Remaining depth B of friction material after machining should be 3.0 ± 0.5 mm from the plate surface.

※ Note : Minimize machining dimension. (To secure friction force.)

3) Correct the condition of contact face (uneven contact, local contact or scratches on rotor surface).

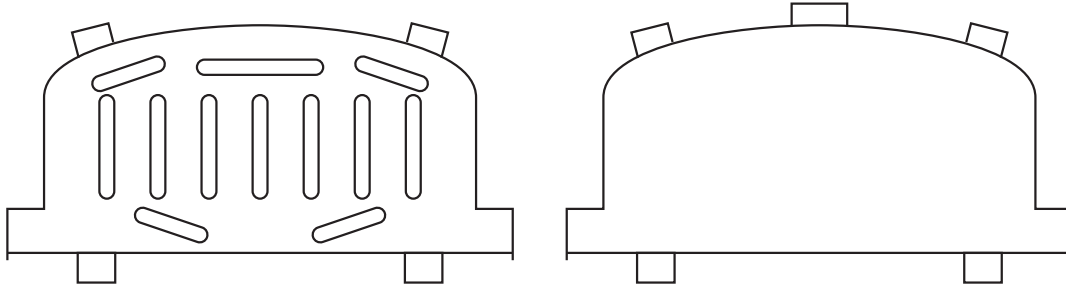

① Machine both friction material and rotor to make them flat.

② Replace with the genuine product.

※ Warning: The friction trace of the rotor surface may not always match with the pad after replacement.

2. Shim installation

Insert a special shim (genuine product reference) to the back of plate. Single and double shims are available. As older shims that show thermal degradation may have no benefit, they should be replaced.

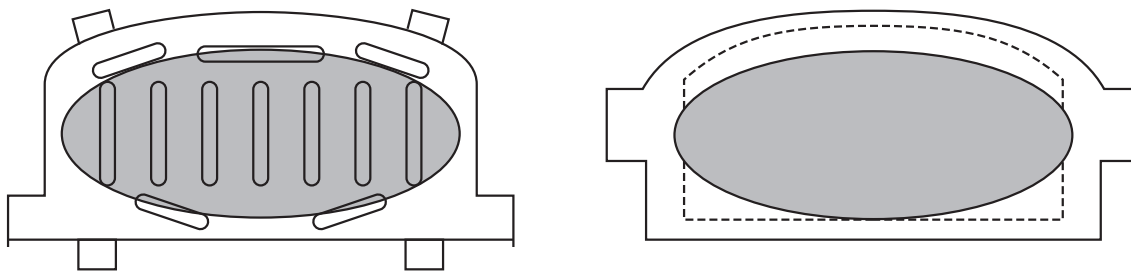

3. Grease application

1) Type of grease: (Mainly molybdenum grease) Various kinds of heat-resistant grease are available commercially.

2) Area of grease application

① Contact face between outer shim and pad

※ Note ① Do not apply grease on friction material or rotor surface (It may lower the friction force).

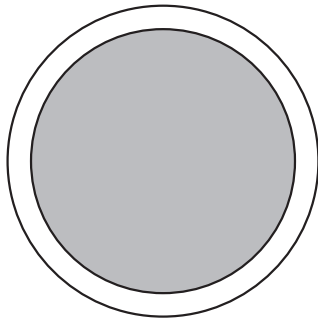

※ Note ② Correctly install not only shims but also small genuine parts when attaching pad.

3) Amount of application: Grease should not be squeezed out from the attaching area.
(Reference: about 3 - 4 g/set)

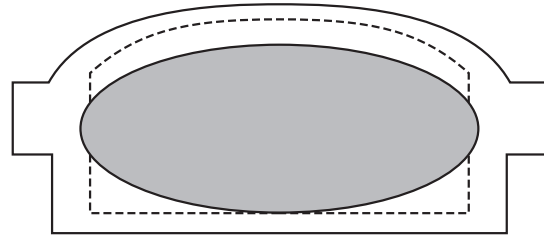

4) Application interval: Apply when replacing parts and recognizing squeak.

5) Application method: Use spray system or manually apply.(tube, canned, plastic bag)

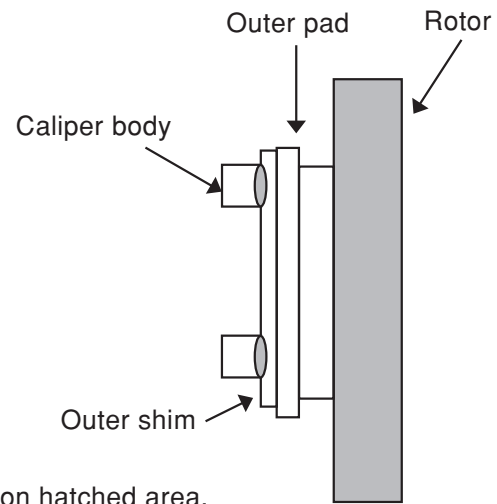

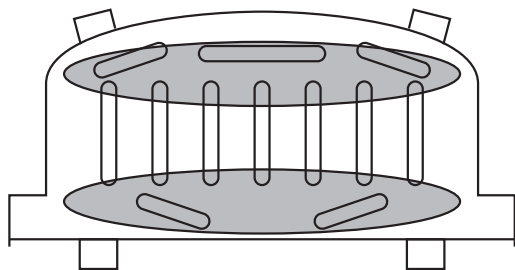

② Contact face between piston end surface and inner pad.

Piston end surface

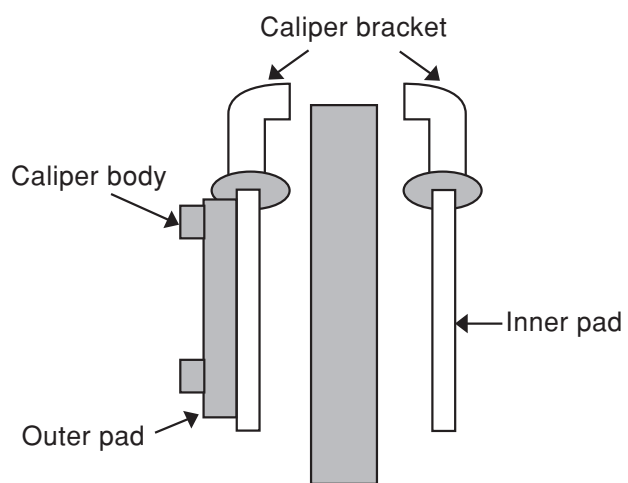

③ Contact face between caliper body and outer shim.

※ Apply on hatched area.

④ Contact face between caliper bracket and pad

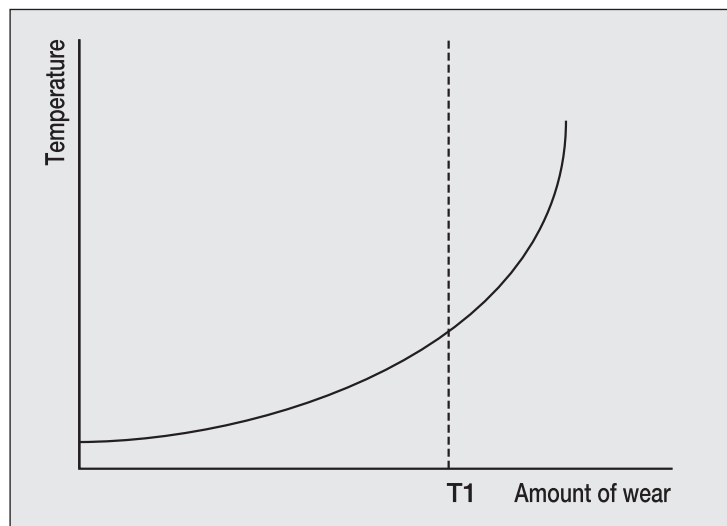

About wear at early stage

Disc brake life is shorter than that of drum brake as the structure of disc brakes limits the area of friction material.

Disc brake are widely used, especially in compact cars, for the following reasons:

- Stable braking effect
- Less fade phenomenon because of effective cooling
- Easy pad replacement

Wear of disc pad at an early stage is mainly caused by exposure of the friction material surface to heat. The relation between the temperature of friction material and the amount of wear shown in the following graph tells that the amount of wear rapidly increases when the temperature exceeds the specific point T1.

Generally T1 is 200 - 250°C for asbestos, and 250 - 300°C for non-asbestos.

Cause of heat generation in disc pad : Braking at high speed and frequent braking on slopes.

Kinetic energy (E) Kinetic energy of the car is proportional to the square of its speed.

$$E = \frac{1}{2}MV^2 \quad M = \text{Mass of car} \quad V = \text{Velocity of car}$$

☆ **The higher the speed, the larger the amount of heat generated, and the friction material will be strongly affected by the heat.**

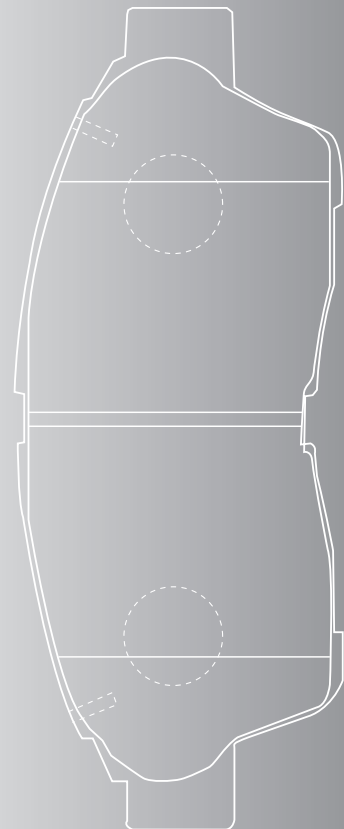

Cause of wear at early stage ⇒ ⇒ ⇒ - Lining temperature rises extraordinarily due to severe operating conditions.

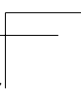

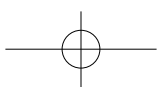

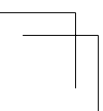

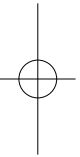

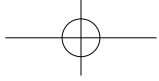

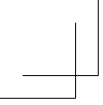

- Inferior piston seal
- Inferior return motion due to cylinder galling
